

M5E Chloramine Disinfection Station

The project consists of chlorine equipment room, ammonia storage room and electrical room. Adjacent to the building there will be a flowmeter, chlorine vault, ammonia vault and well freeboard basin. At this facility the well water will pass through the ammonia and chlorine injection vaults via a 16" discharge main for disinfection prior to being sent into the tanks that supply the 2555 PZ. Construction of this project is schedule to start in early 2009.
